

Aarya Patel – Contest 3

For this I tried with a simple regression model that didn't really work at first and so then shifted to a model which was first a linear layer with an input of 3 and output of 64, a LeakyReLU layer, and then final linear layer which gave a single output from the 64 inputs. I made the batch size the same as the whole training set and then messed around with the epoch number for the best accuracy which was somewhere in the 2000s.
